Sample Trigonometric Ratios Word Problems with Answer Sheets

Problem 1: Calculating the Height of a Tree

Scenario: A surveyor stands 50 meters away from a tall tree. The angle of elevation from the surveyor's eye to the top of the tree is 30° . Find the height of the tree.

Solution:

- Step 1: Draw a diagram with the ground, the tree, and the line of sight.
- Step 2: Identify knowns: adjacent side = 50 meters, angle = 30°
- Step 3: Use tangent ratio: $\tan(30^\circ) = \text{height} / 50$
- Step 4: Calculate height: $\text{height} = 50 \tan(30^\circ)$
- Step 5: Use calculator: $\tan(30^\circ) \approx 0.577$
- Step 6: height $\approx 50 \times 0.577 \approx 28.85$ meters

Answer: The height of the tree is approximately 28.85 meters.

Problem 2: Finding the Distance Between Two Tall Buildings

Scenario: Two buildings are 200 meters apart. From the top of the first building, the angle of depression to the top of the second building is 45° , and the height of the first building is 150 meters. Find the height of the second building.

Solution:

- Step 1: Draw a diagram showing both buildings, the angles, and the ground.
- Step 2: Known: distance between buildings = 200 m, height of first building = 150 m, angle of depression = 45° .
- Step 3: From the top of the first building, the line of sight to the top of the second forms a right triangle.
- Step 4: Use tangent: $\tan(45^\circ) = (\text{height difference}) / 200$
- Step 5: Since $\tan(45^\circ) = 1$, height difference = $200 \cdot 1 = 200$ meters.
- Step 6: Height of the second building = height of first building + height difference = $150 + 200 = 350$ meters.

Answer: The second building is approximately 350 meters tall.

- Visualize the scenario, and draw a diagram to clarify relationships.
- Label all known quantities and variables.

- Decide Which Trigonometric Ratio to Use

- Determine which sides and angles are involved.
- Recall that:
 - Sine ($\sin$) = Opposite / Hypotenuse
 - Cosine ($\cos$) = Adjacent / Hypotenuse
 - Tangent ($\tan$) = Opposite / Adjacent
- Based on the diagram, select the ratio that relates the known and unknown quantities.

- Set Up the Equation

- Write the ratio in terms of known and unknown variables.

- Use algebraic manipulation to isolate the unknown variable.
- Apply inverse trigonometric functions if the problem involves finding an angle.

- Verify the Solution

- Check if the answer makes sense within the context.
- Ensure units are consistent.

- Confirm that the solution respects the geometric constraints (e.g., angles between 0° and 90°).

Examples of Trigonometric Word Problems and Their Answer Sheets

To illustrate the process, consider sample problems with detailed solutions.

Example 1: Height of a Tree Using Angle of Elevation

Problem: From a point on the ground 50 meters away from the base of a tree, the angle of elevation to the top of the tree is 30° . Find the height of the tree.

Solution Steps:

- Draw a diagram: A right triangle with the ground distance (adjacent side) = 50 m, the height of the tree (opposite side) = h , and the hypotenuse connecting the observation point to the top.

- Identify knowns and unknowns:

- Adjacent side = 50 m
- Angle of elevation = 30°
- Unknown height = h

- Select the ratio:

- Use tangent because it relates opposite and adjacent sides:

$$\tan 30^\circ = \frac{h}{50}$$

- Set up the equation:

$$h = 50 \tan 30^\circ$$

$$h = 50 \times \tan 30^\circ$$

$$h \approx 28.9 \text{ m}$$

- Calculate:

\[

$$\tan 30^\circ = \frac{1}{\sqrt{3}} \approx 0.577$$

\]

\[

$$h = 50 \times 0.577 \approx 28.85 \text{ meters}$$

\]

- Final answer:

The height of the tree is approximately 28.85 meters.

Answer sheet notation:

Height of tree ? 28.85 meters.

Example 2: Distance Across a River Using Angle of Depression

Problem: An observer stands on the riverbank and measures an angle of depression of 45° to a boat directly across the river. If the observer's height above the water is 2 meters, find the width of the river.

Solution Steps:

- Draw a diagram: A right triangle with the vertical height of the observer (2 m), the horizontal distance (river width, x), and the line of sight.

- Identify knowns and unknowns:

- Vertical height = 2 m

- Angle of depression = 45°

- Unknown: width of the river = x

- Choose the ratio:

- Since the angle of depression equals the angle of elevation from the boat to the observer, and the line of sight forms a right triangle:

$$\tan 45^\circ = \frac{\text{vertical height}}{\text{distance across the river}}$$

- Set up the equation:

[

$$\tan 45^\circ = \frac{2}{x}$$

]

[

$$1 = \frac{2}{x}$$

]

[

$$x = 2$$

]

- Final answer:

The width of the river is 2 meters.
